

# Discontinuously Reinforced Light Metals for Engine Applications

Martin Wenzelburger, Martin Silber and Rainer Gadow

*Institute for Manufacturing Technologies of Ceramic Components and Composites (IFKB)  
Graduate School for advanced Manufacturing Engineering (GSaME)*

## OPEN TECHNOLOGY FORUM

**Alternative materials and grades to  
improve powertrain characteristics**

**engineexpo2010**

22, 23, 24 June 2010

Messe Stuttgart, Stuttgart, Germany

## Outline:

- Introduction
- Overview about and properties of MMC materials
- MMC in automotive applications: review
- Reinforcement materials
- Theoretical limits of MMC properties
- New manufacturing techniques for particle and short fiber MMC
- Summary and conclusions

# PMC vs. MMC Mechanical Properties - Continuous Fibers

	<i>Boron/Epoxy</i>	<i>Boron/ Aluminum</i>
Specific mass (kg/m <sup>3</sup> )	1950	2650
Longitudinal tensile strength (MPa)	1400	1400
Longitudinal compressive strength (MPa)	2600	3000
Transverse tensile strength (MPa)	80	120
Longitudinal elastic modulus $E_\ell$ (MPa)	210,000	220,000
Transverse elastic modulus $E_t$ (MPa)	12,000	140,000
Shear modulus $G_{\ell t}$ (MPa)		7500
Longitudinal coefficient of thermal expansion at 20°C, $\alpha_\ell$ (°C <sup>-1</sup> )	$0.5 \times 10^{-5}$	$0.65 \times 10^{-5}$

fiber volume fraction: f = 50 %

acc: D. Gay and S. V. Hoa: Composite Materials. CRC Press, 2<sup>nd</sup> ed.

## Advantages of MMC vs. unreinforced Metals and PMC

### With respect to metals:

- Major weight savings due to higher strength-to-weight ratio
- Exceptional dimensional stability (compare for example SiC<sub>p</sub>/Al to Al)
- High temperature stability (creep resistance)
- Significantly improved cyclic fatigue characteristics
- Improved wear resistance

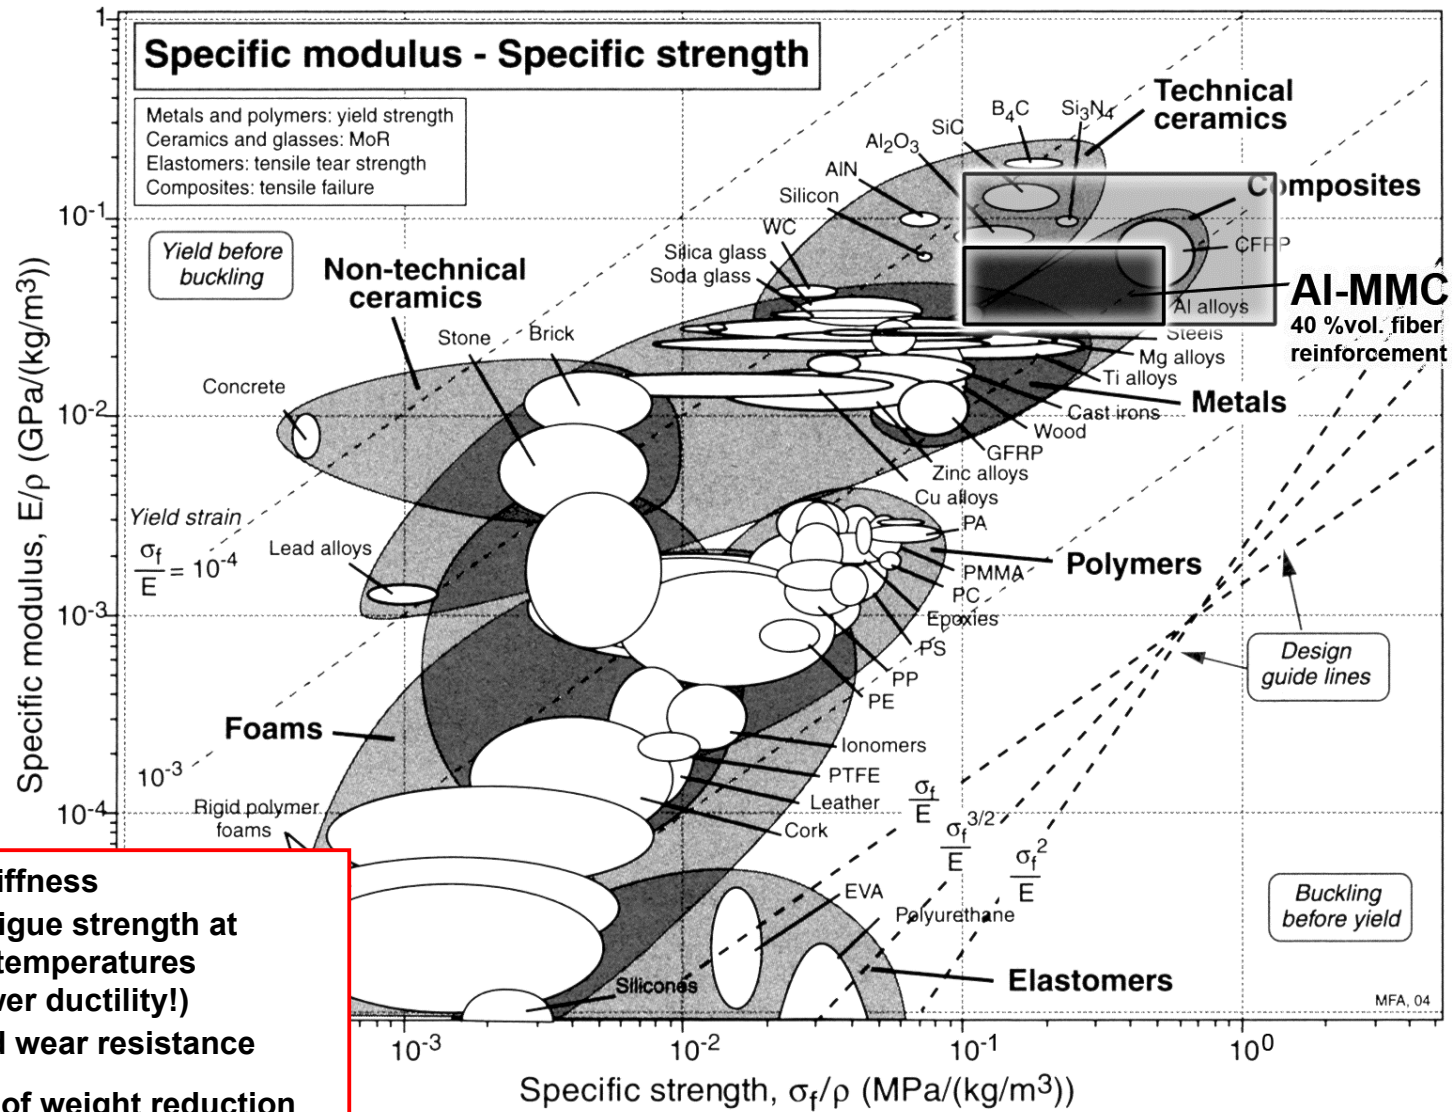

### With respect to PMC:

- Higher compressive strength and stiffness, plasticity and toughness
- Higher operation temperatures
- Higher electrical and/or thermal conductivity
- Better transversal properties
- Ability for welding and soldering
- Easier integration in metal structures
- Radiation resistance (UV, IR, laser, nuclear, etc.)

*acc: N. Chawla, K. K. Chawla: Metal Matrix Composites. New York : Springer, 2006*

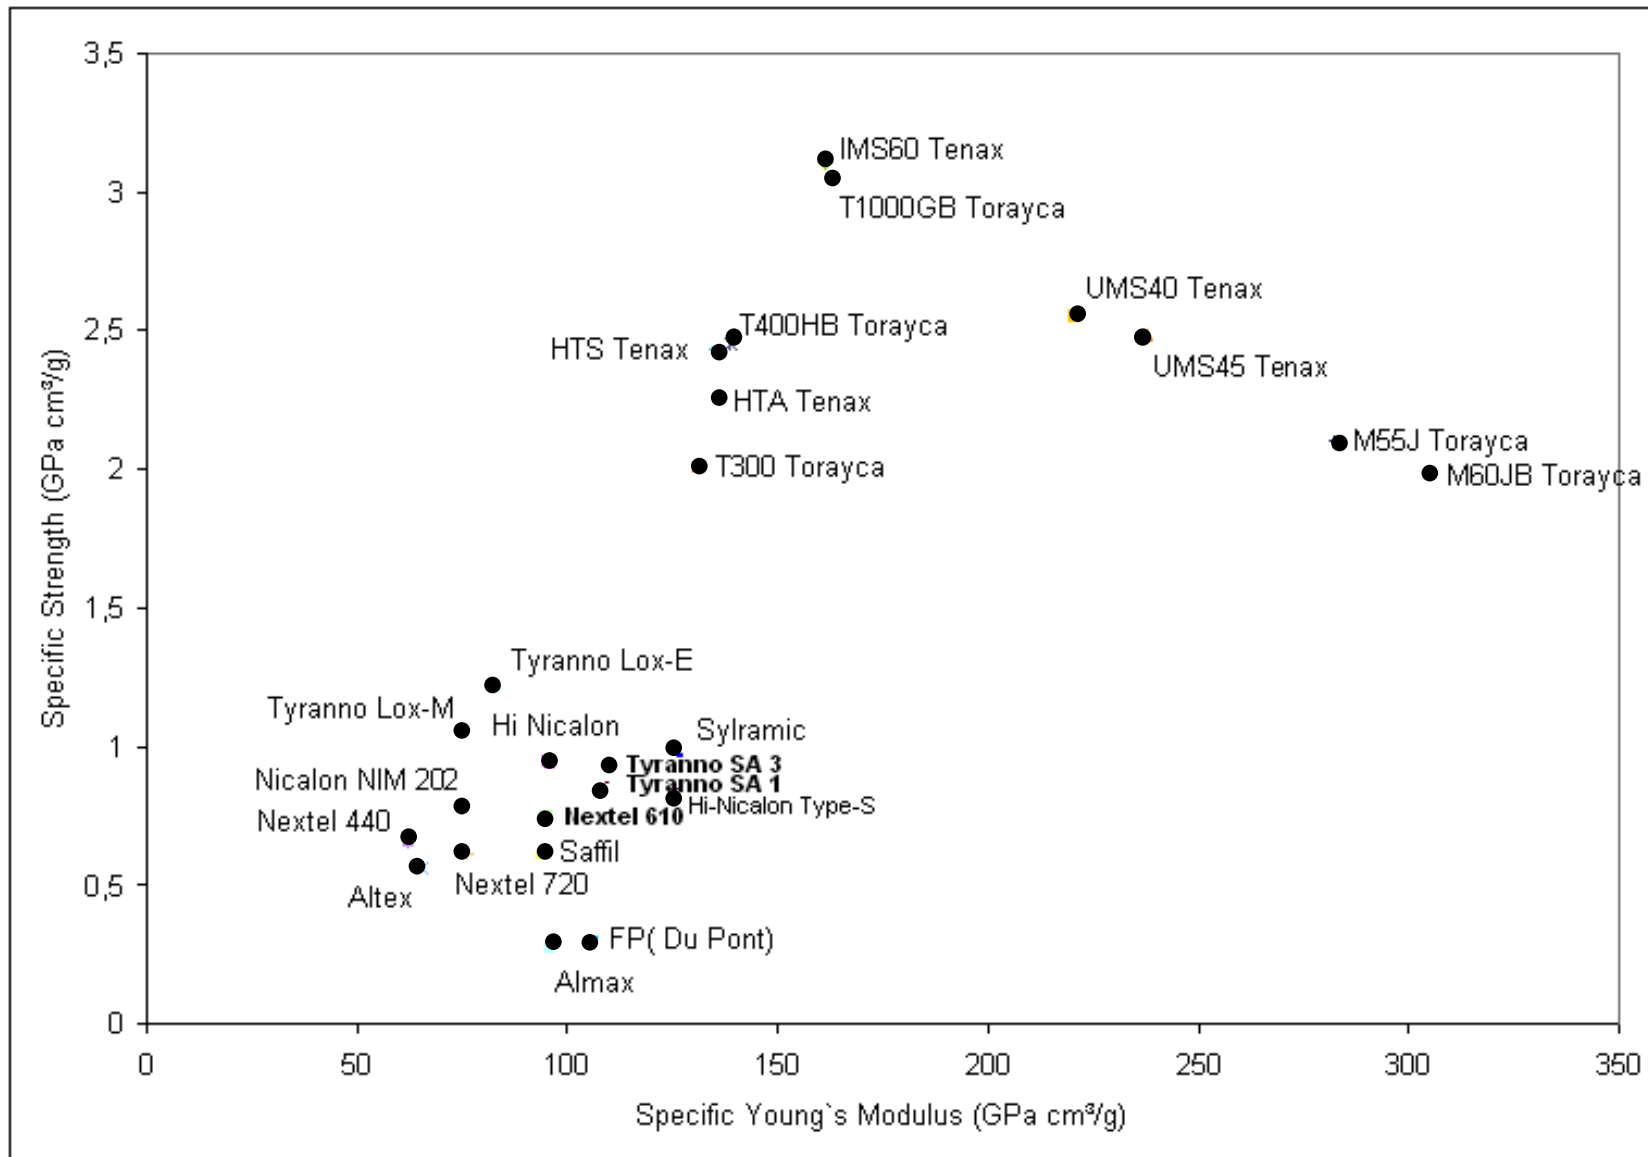

# Materials' Specific (!) Properties according to Ashby

according to: M.F. Ashby: *Materials Selection in Mechanical Design*, 3<sup>rd</sup> ed.  
 Burlington: Butterworth-Heinemann, 2005

- Higher stiffness
- Better fatigue strength at elevated temperatures (BUT: lower ductility!)
- Increased wear resistance
- ➔ Potential of weight reduction

# Specific Mechanical Properties of Reinforcement Fibers

# Review of MMC Applications in Automotive Industry

## Light metal crankcase; particle reinforcement of cylinders and bedplates

- Heterogeneous solutions**  
cast iron & AlSi bushings (Silitec®)
- Monolithic solutions**  
AlSi17Cu4Mg (Alusil®)  
hypereutectic alloy
- Quasi-monolithic solutions**  
preform infiltration (Lokasil®)  
& various coatings

# Types of MMC

Distinction by the shape, character and orientation of the reinforcement phase:

*Continuous and discontinuous reinforcement.*

- ⇒ endless fibers / long fibers
  - UD (uni-directional)
  - 2D (woven structures)
  - 3D (complex preforms)
- ⇒ monofilaments

- ⇒ short fibers
  - ⇒ staple fibers
  - ⇒ whiskers
  - ⇒ particles
  - ⇒ platelets
  - ⇒ in-situ reinforcement
- } • aligned discontinuous fibers  
• off-axis aligned ...  
• randomly oriented ...

acc: T. W. Clyne, P. J. Withers: *An Introduction to Metal Matrix Composites*. Cambridge : University Press, 1993

# Fibers for Light Metal Reinforcement

## Fiber materials for MMC:

- ⇒ carbon (HT, IMS, HMS, UMS):  $\rho = 1.7\text{-}1.8 \text{ g/cm}^3$  !
- ⇒ SiC (Nicalon, Tyranno etc.)
- ⇒ alumina,  $\text{Al}_2\text{O}_3$  (e.g., Nextel 610)
- ⇒ mixed oxides  
(e. g., alumina-silica (Nextel 720), basalt etc.)
- ⇒ B, W, Mo, Ta, Nb, Be
- ⇒ stainless steel, Ti, Ni superalloys

Required properties of fibers for MMC:

- high strength and stiffness
- long-term thermo-chemical stability
- microstructural and mechanical stability
- good bonding to matrix material (interface wetting and adhesion)
- high creep resistance

*HT carbon fibers, coated with precursor based ceramics:*

Fracture surface of Tyranno SA fiber, failed in creep at 1400°C at an applied stress of 1000 MPa

Al<sub>2</sub>O<sub>3</sub> particle filling

## Theoretical Limits of MMC Properties - Stiffness

Theoretical calculation of maximum achievable Young's moduli:

→ Assumption: endless fiber length!

- ▶ Equal strain assumption for axial loading of continuous, aligned fibers

⇒ **Voigt Model;**  
**also: Rule of Mixture!**

$$E_{Voigt,axial} = (1-f)E_M + fE_F$$

⇒ Theoretical maximum value for UD continuous reinforcement

- ▶ Equal stress assumption for transversal loading perpendicular to the fiber direction

⇒ **Reuss Model**

$$E_{Reuss,transversal} = \left[ \frac{f}{E_F} + \frac{(1-f)}{E_M} \right]^{-1}$$

⇒ other possibility: Halpin-Tsai model

→ Voigt is the maximum and Reuss the minimum value of real fiber composites!

*Problem: aligned or stochastically oriented short fibers or particles do not fit to idealized models above!*

## Properties of Discontinuous MMC

For short fibers, whiskers and particles, the average stress in the reinforcement is limited, because

1. load is transferred from matrix to fibers by shear stresses
  2. normal stresses in the fiber/particle decrease at fiber/particle ends
- fibers/particles need a critical length to have a strengthening effect, which depends on the diameter!
- The factor to estimate this effect is the aspect ratio:  $s = l/d$  (length/diameter)

Dependency of strengthening and stiffening factor on reinforcement volume fraction and shape:

► Methods to estimate reinforcement effect and composite properties for non-idealized inclusions:

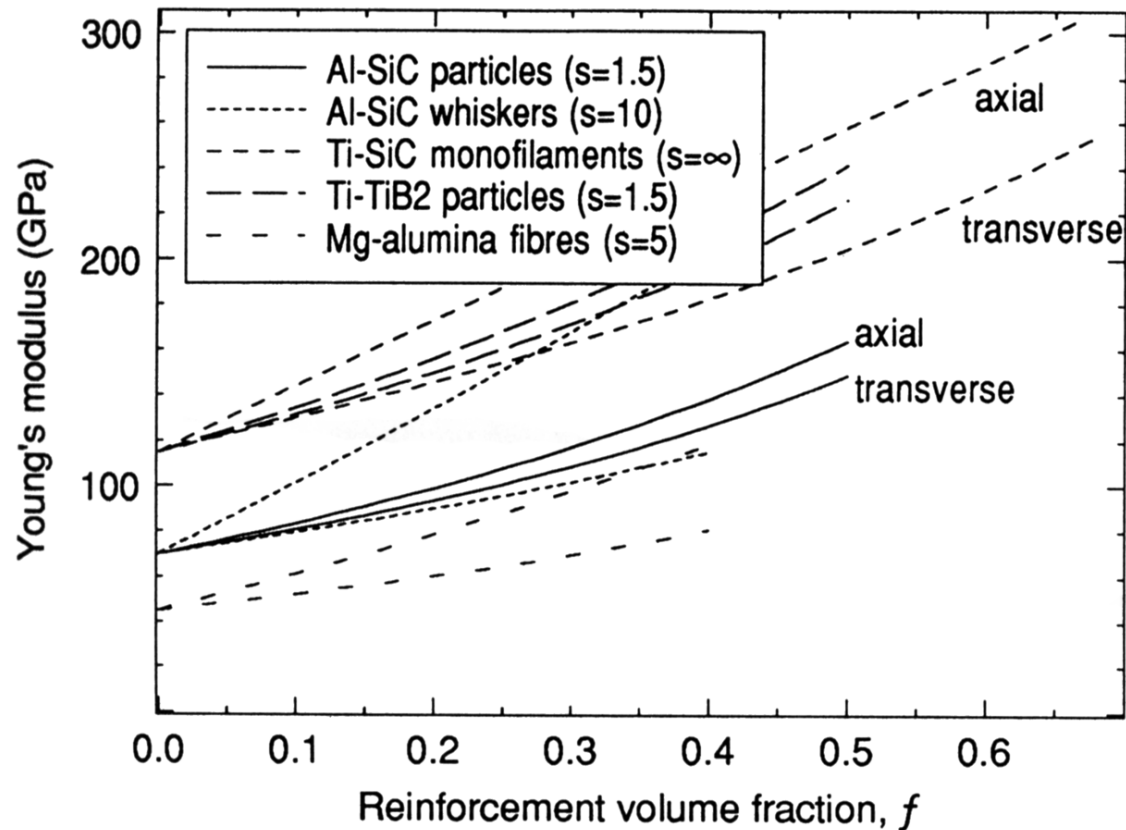

- ⇒ experimental data
- ⇒ modelling (e. g., Eshelby approach)
- ⇒ modified rule of mixture

acc: T. W. Clyne, P. J. Withers: *An Introduction to Metal Matrix Composites*. Cambridge : University Press, 1993

## Properties of MMC - Stiffness

Stiffness depending on:

- matrix alloy
- reinforcement phase
- reinforcement volume fraction,  $f$
- reinforcement aspect ratio,  $s$

acc: T. W. Clyne, P. J. Withers: *An Introduction to Metal Matrix Composites*. Cambridge : University Press, 1993

# Properties of Aluminum Matrix Composites (AMC)

*Comparison of properties for particle (PRM), short fiber (SFRM) and continuous fiber (CFRM/UD) reinforcement*

Material		Al alloy (reference)	PRM	SFRM	CFRM/UD <sup>1</sup>

## Potential of Discontinuously Reinforced MMC for Engine Environment

- ➔ Lightweight potential for reduction of weight AND increase of specific properties!
- ➔ Carbon fibers have the highest potential, but are sensitive.
- ➔ Ceramic particles are suitable for increased stiffness, creep strength and, additionally, tribological behavior.
- ➔ Mainly increase of hot strength, fatigue strength and wear resistance  
→ increase of important properties in engine environments !
- ➔ Thermophysical properties (e. g., thermal expansion) can be influenced in a wider range than for continuous fiber MMC

## Drawbacks

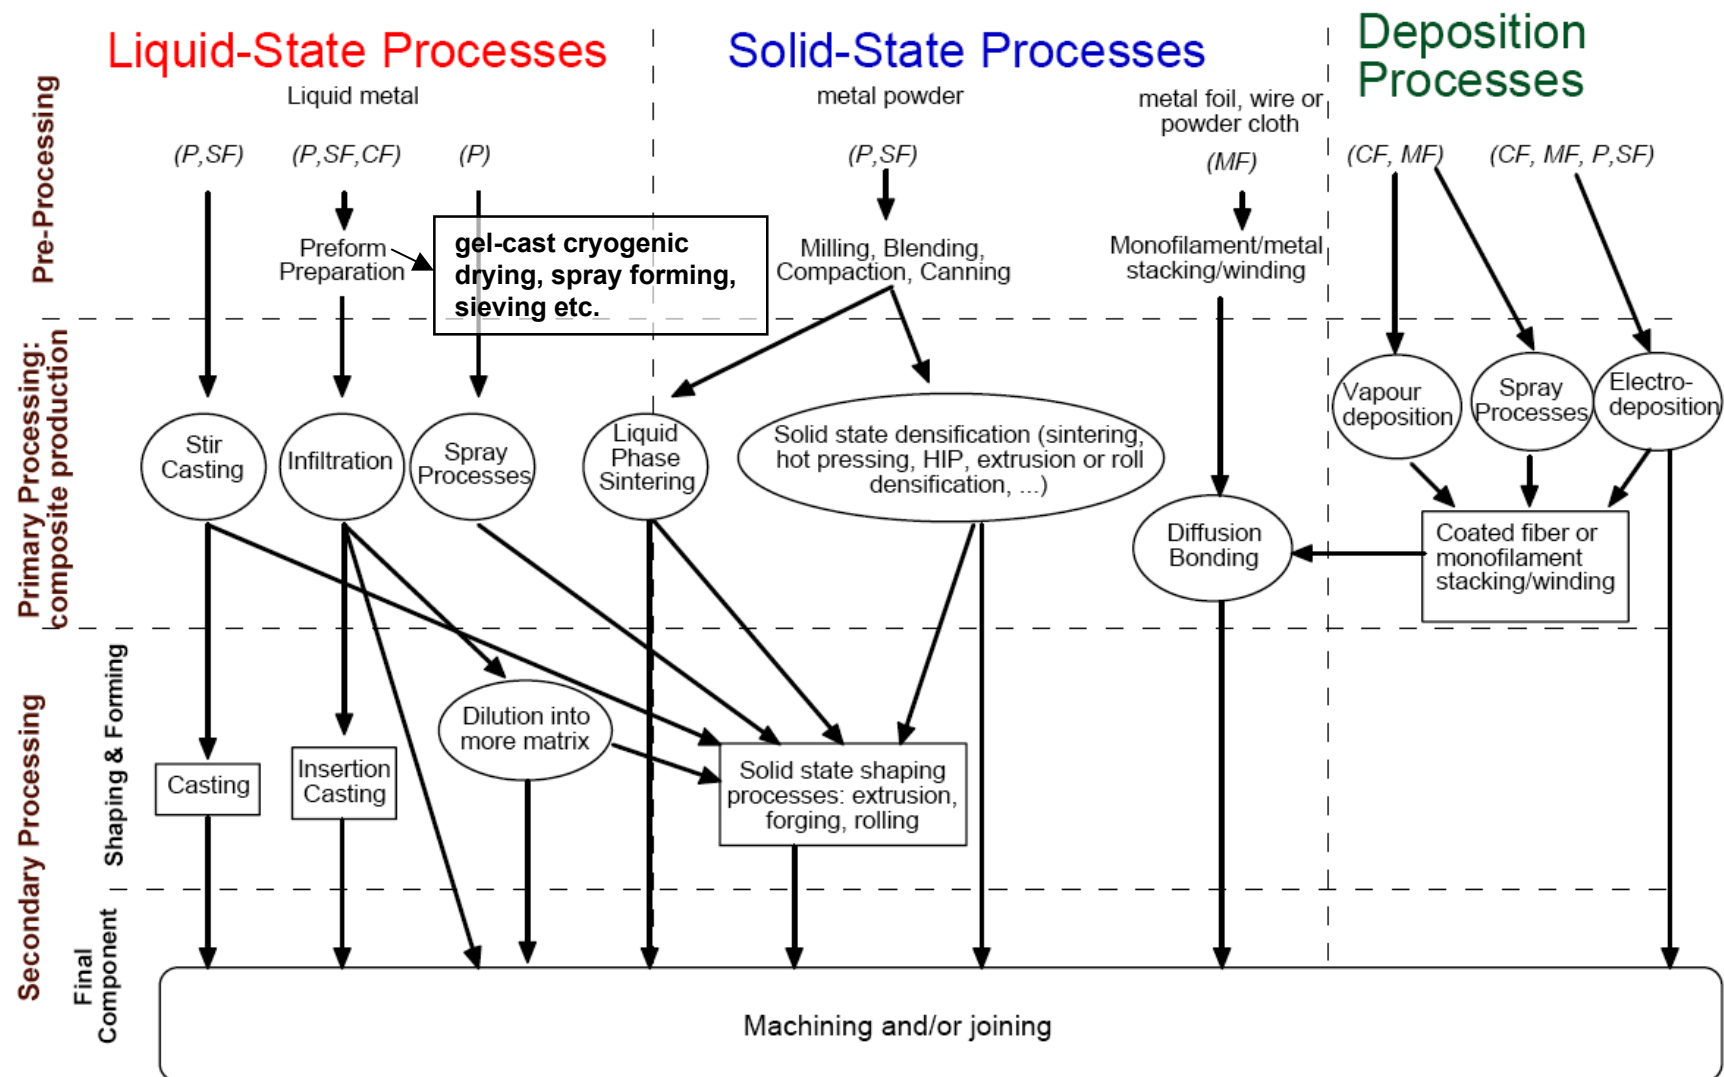

- ☎ Reinforced materials with metal matrix show interesting specific properties, and thus, are suitable for weight reduction and performance increase of automotive vehicles.
- ☎ NO important strengthening at room temperature for discontinuous reinforcement (rather increase of creep resistance and strength at elevated temperature!)
- ☎ Low plastic deformation capability, low ultimate strain (however, more deformation than for PMC, e. g. CFRP, and continuously reinforced metals)
- ☎ High cost of materials AND of production for available standard processes

## Challenges for AMC Process Development

- ➔ Suitable embedding of the reinforcement phase (good reinforcement/matrix interface!)
- ➔ Improvement of carbon fiber useability through fiber surface engineering by fiber coating
- ➔ Limitation of cost by new, simple processing methods

➔ Process engineering is the key to success !

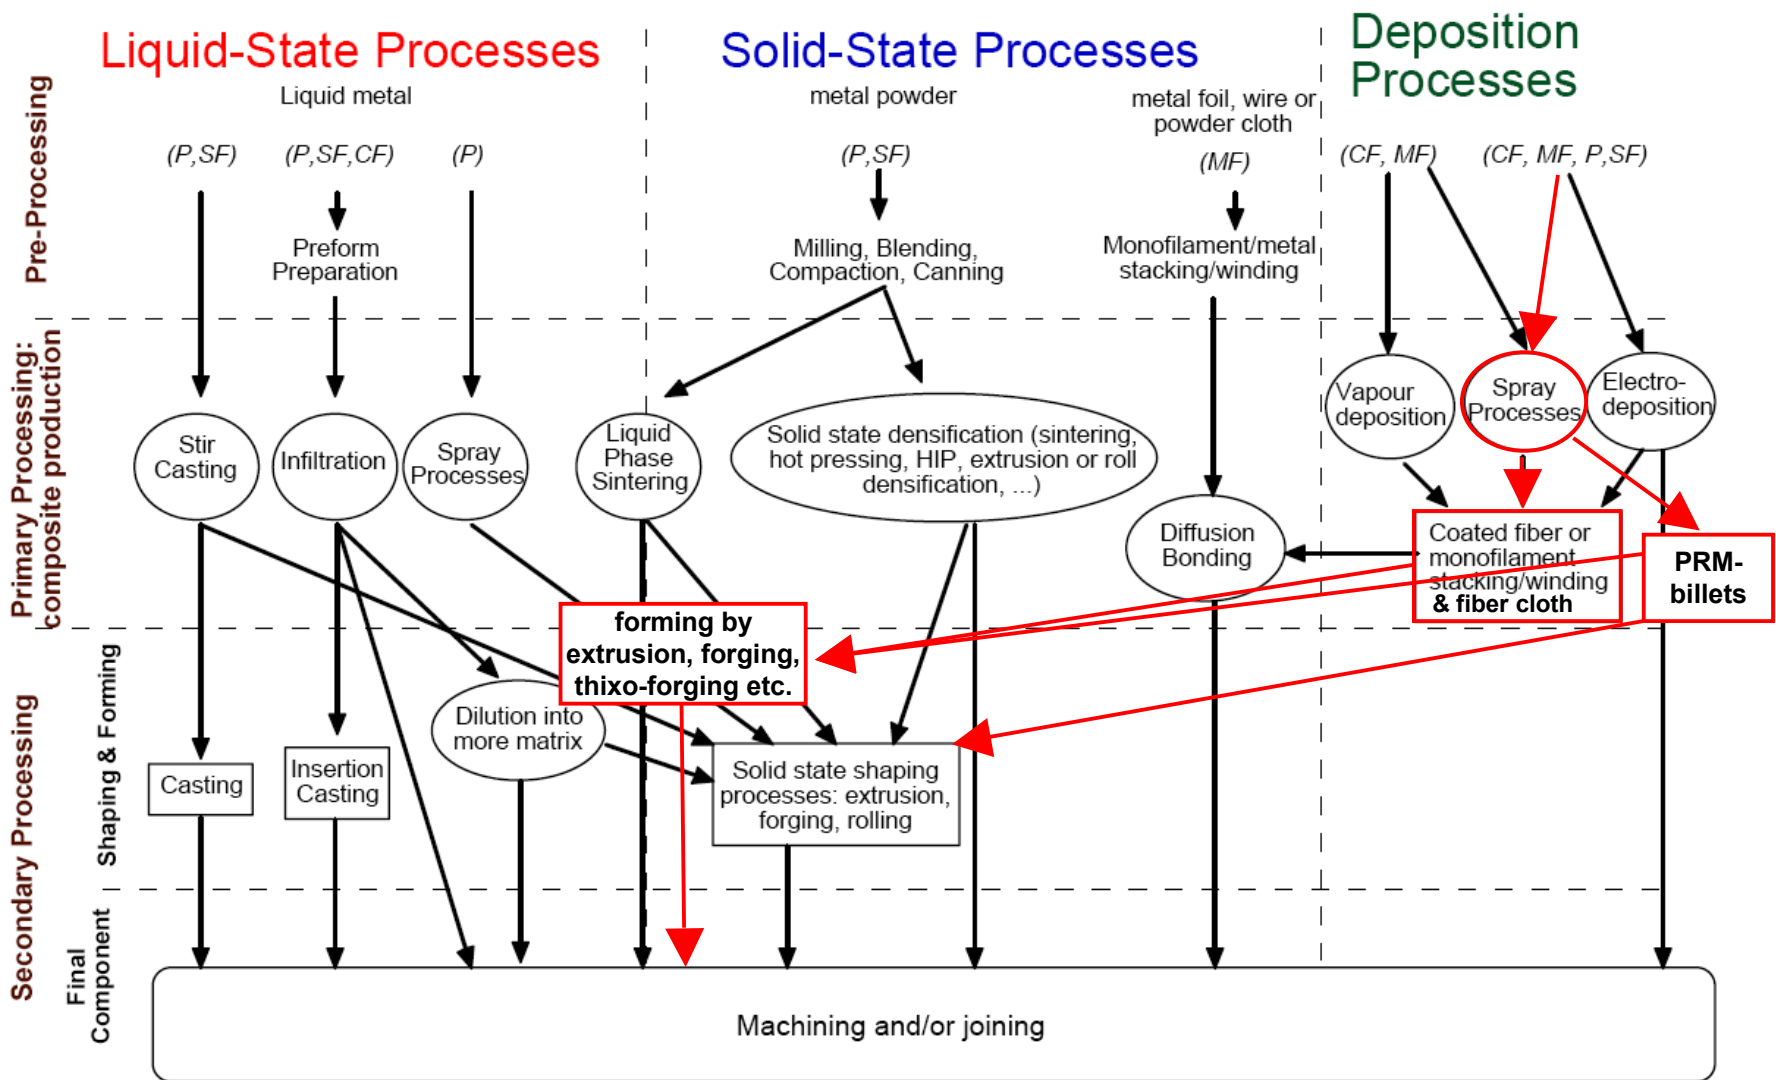

# Possibilities in MMC Manufacturing

Reinforcements: P = particles, SF = short-fibers, CF = continuous fibers, MF = monofilaments

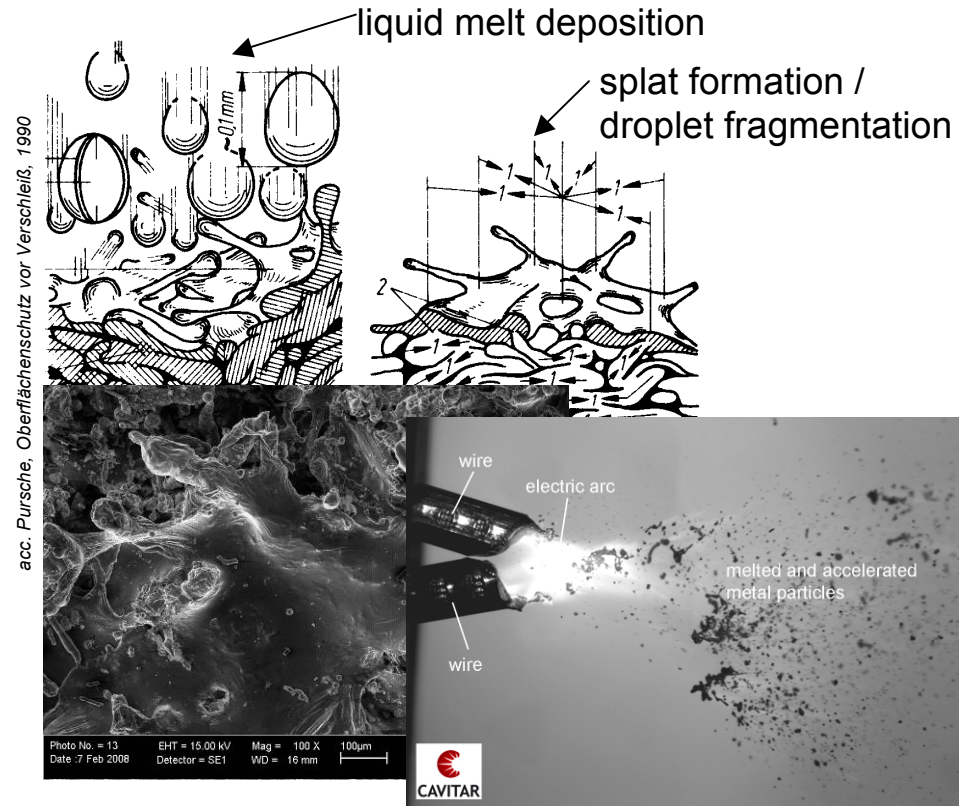

acc: A. Mortensen, EPFL, Lausanne

# New Process Developments – Reducing Cost for Automotive Usability

Reinforcements: P = particles, SF = short-fibers, CF = continuous fibers, MF = monofilaments

# Material Deposition by Twin-Wire Electric Arc Spraying

**Energy source:** electric arc  
**Max. process temp.:** 4000 °C  
**Materials:** metals, alloys, cored wires with ceramic particles  
**Particle velocities:** < 150 m/s  
**Deposition rate:** 20 – 300 kg/h  
**Wire diameter applied:** 1.6 mm

## Process parameters of the twin wire electric arc process applied in this work:

	Voltage, U (V)	Feed Rate, f (m/min)	Air Pressure, p (bar)	Particle Velocity, $v_p$ (m/s)	Particle Temp., $\vartheta_p$ (°C)
Machine parameters	22.0	3.3	3.0	-	-
Direct spray parameters	-	-	-	1000 – 110	2,400 – 2,500

## Manufacturing of Short Fiber Prepregs by Thermal Spraying (TS)

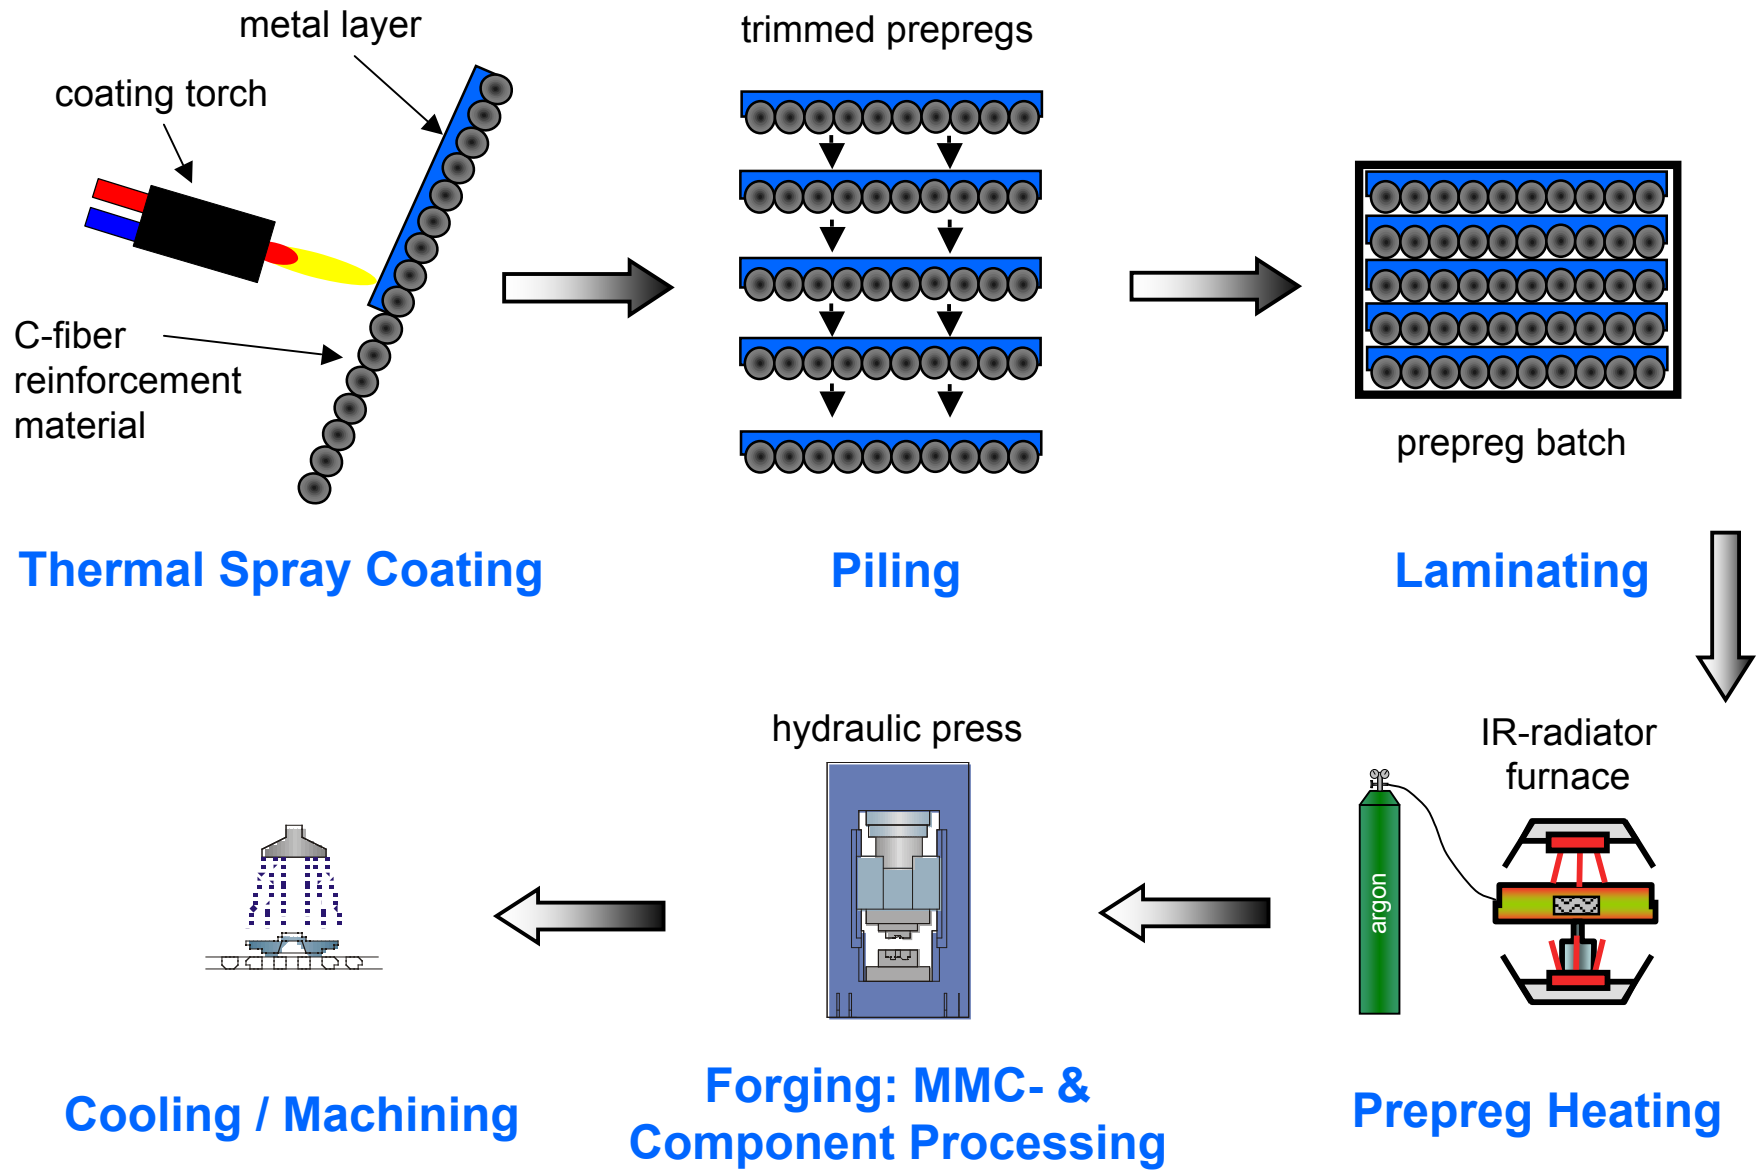

Coated fleece sheets with different coating thickness:

⇒ Tailoring of the fiber volume content!

*Thermally sprayed Al Si5 matrix and HT carbon fiber fleece substrate (SEM).*

# Complete Process Chain for MMC Manufacturing

## Microstructure of C-Fiber/Al Si5-MMC (Thixoforged)

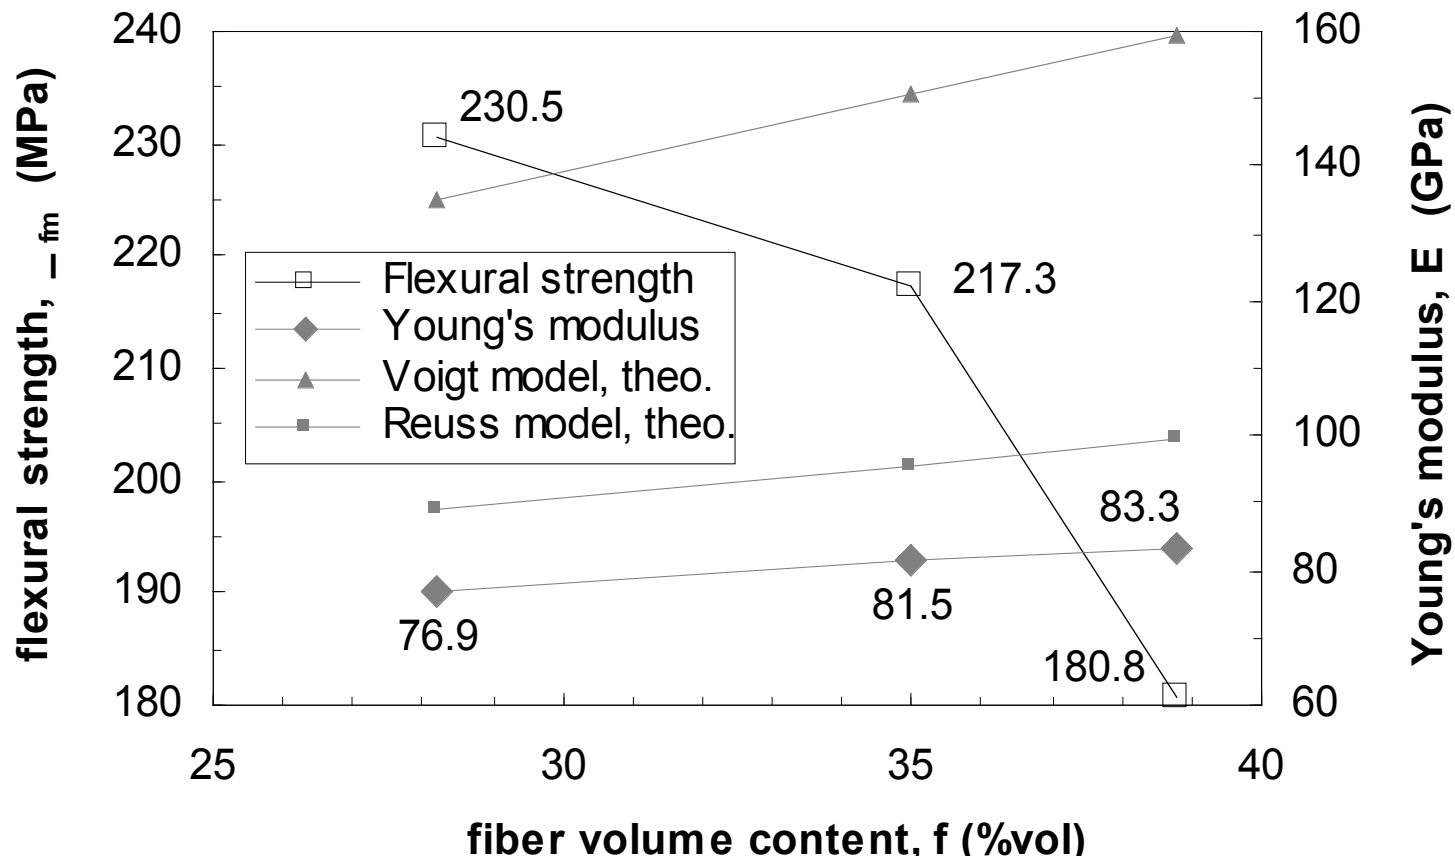

*Micrographs of thixoforged C-short-fiber/Al Si5-MMC after bending experiments, different fiber volume contents.*

- ▶ Residual porosity of  $\leq 0.5$  %vol.
- ▶ Homogeneous, stochastic fiber distribution.
- ▶ Matrix accumulation at component surface.
  - ⇒ Thereby, change of fiber volume content!
- ▶ Grain growth due to slow cooling in the die.
- ▶ Clustering of eutectic (liquid) phase in prepreg porosity.

## Experimental MMC Properties Depending on Fiber Volume Content

Flexural strength,  $\sigma_{fm}$  (4-point bending), and Young's modulus,  $E$ , for C-short-fiber/Al Si5-MMC with  $f = 28.2, 35.0, \text{ and } 38.8$  %vol.

## Comparison of Material Properties

*Mechanical properties of aluminum alloys and HT carbon fibers, tensile testing:*

Alloy Material	Young's Modulus, E (GPa)	Tensile Strength, UTS, $\sigma_{t,m}$ (MPa)	Yield Strength, YS, $\sigma_y$ (MPa)	Strain to Failure (%)
Al Si5 wire, T4	70	130	70	15
Al Si7Mg cast alloy	72.4	140 – 240	80 – 220	1 – 2.5
Al Si7Mg0.3 cast alloy	72.4	200 – 340	120 – 280	2 – 9
Carbon fiber, HT type	230 – 300	4,000 – 7,000	-	1.7 – 2.4

*Mechanical properties of HT C-short-fiber/Al Si5-MMC, bending experiments:*

C-fiber/Al Si5-MMC Fiber Volume Content, f (%vol)	Young's Modulus, E (GPa)	Flexural Strength, $\sigma_{f,m}$ (MPa)	Yield Strength, YS, $\sigma_y$ (MPa)	Strain to Failure (%)
28.2	76.9	230.5	-	~ 0.8
35.0	81.5	217.3	-	~ 0.6
38.8	83.3	180.8	-	~ 0.4

## Fracture Behavior (SEM Analysis)

*SEM of fracture surfaces from 4-point bending experiments, different fiber volume contents.*

- ▶ Extensive debonding of transverse fibers.
- ▶ Low plastic deformation of the matrix material.
  - ⇒ Deformation in load direction, as would be expected for MMC, only in some areas!
- ▶ Interfacial debonding and (short) fiber pull-out.
  - ⇒ Structure of the thermally sprayed, reheated and thixoforged matrix more brittle than original Al Si5!
  - ⇒ Fiber/matrix bonding is relatively weak!

# Deposition of PRM Billets by Arc Wire Spraying

Angle variation in order to avoid shadowing effects and influences on porosity and microstructure

installation and processing for the deposition of massive spray billets on a rotating table by thermal spraying with the arc wire technique
